

Course Name & Code: Statistics for Engineers - MAT2001
Slot: B1 + TB1

Exam Duration: 90 minutes

Maximum Marks: 50

Answer All the Questions ($5 \times 10 = 50$)

Use of statistical tables permitted

S. No.	Question	Marks																																	
1.	<p>An experiment was conducted to determine if the weight of an animal can be predicted after a given period of time on the basis of the initial weight of the animal and the amount of feed that was eaten. The following data, measured in kilograms, were recorded:</p> <table> <tr> <th>Final Weight, y</th><th>Initial Weight, x_1</th><th>Feed Weight, x_2</th></tr> <tr><td>95</td><td>42</td><td>272</td></tr> <tr><td>77</td><td>33</td><td>226</td></tr> <tr><td>80</td><td>33</td><td>259</td></tr> <tr><td>100</td><td>45</td><td>292</td></tr> <tr><td>97</td><td>39</td><td>311</td></tr> <tr><td>70</td><td>36</td><td>183</td></tr> <tr><td>50</td><td>32</td><td>173</td></tr> <tr><td>80</td><td>41</td><td>236</td></tr> <tr><td>92</td><td>40</td><td>230</td></tr> <tr><td>84</td><td>38</td><td>235</td></tr> </table> <p>(a) Fit a multiple regression equation of the form $Y = \beta_0 + \beta_1 x_1 + \beta_2 x_2$</p> <p>(b) Predict the final weight of an animal having an initial weight of 35 kilograms that is given 250 kilograms of feed.</p>	Final Weight, y	Initial Weight, x_1	Feed Weight, x_2	95	42	272	77	33	226	80	33	259	100	45	292	97	39	311	70	36	183	50	32	173	80	41	236	92	40	230	84	38	235	10
Final Weight, y	Initial Weight, x_1	Feed Weight, x_2																																	
95	42	272																																	
77	33	226																																	
80	33	259																																	
100	45	292																																	
97	39	311																																	
70	36	183																																	
50	32	173																																	
80	41	236																																	
92	40	230																																	
84	38	235																																	
2.	<p>The finished inside diameter of a piston ring is normally distributed with a mean of 10 centimeters and a standard deviation of 0.03 centimeter.</p> <p>(i) What proportion of rings will have inside diameters exceeding 10.075 centimeters?</p> <p>(ii) Below what value of inside diameter will 15% of the piston rings fall?</p>	10																																	
3.	<p>In a certain city, the daily consumption of electric power, in millions of kilowatt-hours, is a random variable X having a gamma distribution with mean $\mu = 6$ and variance $\sigma^2 = 12$.</p> <p>(i) Find the values of α and β.</p> <p>(ii) Find the probability that on any given day the daily power consumption will exceed 12 million kilowatt hours.</p>	10																																	

4. 500 articles from a factory are examined and found to be 2% defective. 800 similar articles from a second factory are found to have 1.5% defectives. Can it be reasonably concluded that the products of the first factory are inferior to those of the second, at 5% los? 10
5. A certain intelligence test was administered to a large group of students and it has been found that the SD of the score is 36. The test is given to a group of 120 boys and they got an average score of 124. Another group of 125 girls to whom also the test was given scored an average of 130. Does this show any significant difference between the groups, at 5% los? 10
